

FACTS ABOUT SYSTEM BUILT HOMES...

- System built homes are built with components in a controlled production facility to the same building codes as traditional site-built housing.
- "System built" or "modular" are sometimes confused with "mobile" or "manufactured" homes. Mobile housing is built to an entirely different code and there is no comparison to system built homes.
- System built homes are generally stronger and better built than many stick-built homes since they often must be shipped as far as 400 miles from the manufacturing facility.
- Homebuyers can often save money by choosing a home constructed of system built components over a comparable traditional site-built home.
- System built housing meets the design and budget needs for both affordable housing and high-end luxury housing.
- The latest computerized technology allows complete freedom of design and customizing.
- System built housing is growing at about 10% annually and expected to be a \$16 billion market by the end of the century.
- System built homes are environmentally friendly since excess materials are recycled at the factory and waste materials, noise, pollution and overall disturbance at a building site are generally reduced.
- All our homes are now certified Green.
